GHG Statement Report

Version 1.7

Information requirements for verification are as follows:

- GHG Statement Report (this document) containing information relating to the GHG Statement
- GHG Statement calculations (provided separately)
- Supporting information including copies of raw data used

An appropriate level of information should be provided with a clearly referenced and transparent audit trail of decision making, assumptions, explanations, such that a verifier can trace all inputs, outputs and decision making. All data sources and assumptions must be clearly referenced, transparent and traceable.

After this document has been completed for the first time, it may be acceptable to refer back to relevant sections for subsequent Reporting Periods, for example if there have been no changes to the GHG Assessment scope, data collection methodology, calculation methodology or assumptions.

There is no word limit for answers in sections below.

Section A – General Project Information

General Information	
Name of practitioner who prepared the GHG Statement, and relevant competencies. This should include an overview of relevant qualifications and experience undertaking GHG assessments.	Garrett Lutz Charm Industrial Carbon Accounting Associate
Name of Project / link to Project page on Isometric Registry	Charm Bio-Oil Geologic Storage
Date of report	8/11/26
Please specify the Reporting Period this GHG Statement has been prepared for (the Reporting Period describes the time period over which the carbon removal activity assessed in the GHG Statement occurred)	7/1/26-7/31/26
Relevant project information if not included in PDD	N/A

Details and links to any supporting documentation	All raw data and supporting documentation has been submitted either 1) directly to Isometric DMRV, or 2) directly to the VVB
Please confirm that the GHG Statement has been undertaken in accordance with the information provided in the project boundary section of the PDD. Provide any additional information relating to the GHG Statement project boundary here.	Confirmed

Section B – Project Details

B. GHG Statement - Project Details
Provide information on the Project design and implementation concerning the reporting period. *This should include the following information as a minimum:* ● *Key features of the Project including a technical description* ● *information on the implementation status of the project, For the description of the installed technologies, technical processes and equipment, include diagrams, where appropriate*
Ongoing Operations This reporting period continued steady-state injection operations at the Basco 6 site in Evangeline Parish, Louisiana. Injections ran across four weekly batches (INJ-07-2026-W1 through W4), covering nine removals totalling 710,723.48 kg of bio-oil injected. Kerry Taste and Nutrition bio-oil transitioned from IBC tote delivery to bulk tanker delivery during this reporting period. Delivered mass is now determined from certified truck-scale tickets (full and empty) rather than individual tote tag weights. Kerry oil takes a filtration mass deduction and no sparging deduction. The filtration solids basis applied is 0.071%, taken from a May 2026 measurement of phase-separated Kerry calciner tar; Kerry does not currently supply a per-shipment solids certificate and Charm's standing laboratory panel does not include a solids method, so this single measurement is applied to the period to ensure only injected bio-oil is credited.

Section C – Project Changes

C.1 Summary of changes

Please provide details of any changes or deviations from the planned implementation, operation, or monitoring of the project activity that occurred during this reporting period. Project Proponents must determine whether the changes are temporary deviations or permanent changes.
Temporary deviations could include deviations from:

a) *The monitoring plan mentioned in the approved PDD.*
b) *The applied Protocol.*
c) *The applied modules.*
d) *Data collection procedure.*

If there were any temporary changes or deviations corresponding to this reporting period, please include the details of those changes in this section. If the changes do not fall into the above categories, please note them in Section F of the corresponding PDD instead.

(If there were no deviations during the reporting period, this section is not applicable. In that case, kindly leave this section blank and mention "Section is intentionally left blank.")

Charm-Produced Bio-Oil Injections - Production Period MRV
Charm's integration of dMRV functionality for our CO production facility is not yet complete at the time of this report because of ongoing technical discussions with Isometric's digestion of the data. Emissions for Charm oil have been computed and reported using the same spreadsheet-based method as outlined in the previous GHG Statement Report. Any product sequestered in this period has an associated data package detailing the carbon accounting and how emissions are allocated to that product.

Standard Bio-Oil Mass Deduction for Mass Lost to Sparging
Because sparged oil is no longer offloaded into trucks and weighed prior to injection, our Materials Science team performed a set of benchtop experiments, sparging bio-oil with set points designed to mimic the conditions of oil being sparged in bulk. Based on the results of these trials, an average mass loss of 1.29% was observed across multiple samples. For all oil sparged on site, 1.29% of the input mass is deducted from the MOBI to account for the loss of light compounds during the sparging process.

QOWV Batch Injected in June and Reported in July
One QOWV batch (rmv_1KZBTSNE81S0DJT1) was physically injected during the 2026-06-06 to 2026-06-13 window but is reported in this Reporting Period, within the INJ-07-2026-W1 batch. This delay necessary as we had not yet received the testing to characterize this batch by the scheduled submission date. The oil was not included in the June GHG Statement and is claimed here for the first time. Supporting ops notes and the associated laboratory certificate of analysis are attached to the corresponding datapoints in Isometric.

C.2 Impact of changes

For each deviation, provide a description of the nature, extent and duration of the non-conforming reporting period, and:

a) *Propose alternative monitoring arrangements for the non-conforming reporting period; or*
b) *Apply the most conservative values approach*

(If there were no deviations during the reporting period, this section is not applicable. In that case, kindly leave this section blank and mention "Section is intentionally left blank.")

Section is intentionally left blank.

No deviations occurred during this reporting period; therefore, no impact assessment is required.

Period of change	*Nature of change*	*Impact of change*
Current Reporting Period	Use of spreadsheets, rather than Ledger API, to compute carbon intensity of Charm-produced bio-oil	De Minimis
Current Reporting Period	Use of standard mass-loss based on empirical observation to account for mass change during sparging	De Minimis
Current Reporting Period	June QOWV injection reported this period due to testing delay	N/A

Section D – GHG Statement Methodology

D.1 GHG Statement Methodology - Data

Provide information on the GHG Statement approach and methodology in relation to data collection.

This should include the following information as a minimum:

- *Data collection procedures - how data was requested and gathered, who supplied each data point, the format data was received in, and the date data points were received*
- *How data quality was assessed and how the data hierarchy was followed in terms of using measured, calculated and estimated data. Evidence and justification should be provided in any cases where measured data was not used*
- *Details of data validation processes followed, including treatment of missing data*

Evidence of all raw data that informed the assessment (including data that informed any assumptions) must be appended to the PDD, or linked within the GHG Statement.

Please see corresponding PDD Appendix

D.2 GHG Statement Methodology - Calculations

Provide information on the GHG Statement approach and methodology in relation to calculations.

This should include the following information as a minimum:

- *General description of the methodology, criteria and procedures used as a basis for the assessment, including reference to any documentation (including Isometric protocols and modules), guidance, industry standards and best practice that were followed*
- *Information on calculation procedures followed*
- *Information on any tools used as part of the assessment*
- *Procedure for selecting emission factors including how age (age of data, and the period over which they have been collected), geography (the region or country from where the data have originated), technology (whether the data are specific to a particular technology or mix of many), methodology (the approach applied to gather or calculate the data) and competency (proficiency of entity that developed the data) were considered.*
- *Assumptions and limitations - provide full transparency in terms of value-choices, rationales and expert judgements*
- *Details of a sensitivity analysis, how parameters were assessed and evidence behind choices*
- *Details of uncertainty analysis*
- *Details of any uncertainty adjustments (e.g. %) applied in instances of high uncertainty*

Please see corresponding PDD Appendix

Section E – GHG Statement Results

	Kg	MT
Gross Bio Oil Sequestered	710,723.48	710.72
	Kg CO2e	MT CO2e
Gross CO2e Sequestered	1,001,875.00	1,001.88
Project Emissions	Kg CO2e	MT CO2e
Process Emissions	170,605.00	170.61
Site+Amortized Embodied Emissions	26,510.00	26.51
Uncertainty Discounts	5,468.00	5.47
Emissions Reductions	74,998.00	75.00
Total Emissions for Reporting Period (kg)	202,583.00	

Total Emissions for Reporting Period (MT)	202.58	
Net Removals for Reporting Period (kg)	874,290.00	
Net Removals for Reporting Period (MT)	874.29	

Section F – GHG Statement Version Changes

GHG Statement Version Changes

For each statement resubmission, please specify the new version date (which is the same as the resubmission date) and the updated total of CO_2e tonnes removed.

GHG Statement Versions

Version date	*Total CO_2e tonnes removed*
8/14/26	874.29

Document History

Version	Date	Description
v1.6	June 2024	Revision to include Section F - GHG Statement Version changes, in line with the versioning product experience
v1.5	May 2024	Revision to include section on project changes, and other editorial changes
v1.4	November 2023	Public version
