GHG Statement Report

Information requirements for verification are as follows:

- GHG Statement Report (this document) containing information relating to the GHG Statement
- GHG Statement calculations (provided separately)
- Supporting information including copies of raw data used

An appropriate level of information should be provided with a clearly referenced and transparent audit trail of decision making, assumptions, explanations, such that a verifier can trace all inputs, outputs and decision making. All data sources and assumptions must be clearly referenced, transparent and traceable.

After this document has been completed for the first time, it may be acceptable to refer back to relevant sections for subsequent Reporting Periods, for example if there have been no changes to the GHG Assessment scope, data collection methodology, calculation methodology or assumptions.

There is no word limit for answers in sections below.

General Information	
Name of practitioner who prepared the GHG Statement, and relevant competencies. This should include an overview of relevant qualifications and experience undertaking GHG assessments.	*Verification Package Owner: Matthew Bagtas, Subsurface Data Analyst; Jose Ubillus, Data Lead* *Peer Reviewer: Mattie Friday, Carbon Removal Geoscientist;*
Name of Project / link to Project page on Isometric Registry	https://registry.isometric.com/account/certify/project/prj_1K7HK8Q4S1S0D4W4/overview
Date of report	7/26/2026
Please specify the Reporting Period this GHG Statement has been prepared for (the Reporting Period describes the time period over which the carbon removal activity assessed in the GHG Statement occurred)	2/21/2026 – 7/10/2026
Relevant project information if not included in PDD	Vaulted currently owns the environmental attributes of receiving credits for injection operations; Advantek and Geoenvironment still own and operate
Details and links to any supporting documentation	

Please confirm that the GHG Statement has been undertaken in accordance with the information provided in the project boundary section of the PDD. Provide any additional information relating to the GHG Statement project boundary here.	Yes

GHG Statement Methodology - Data
Provide information on the GHG Statement approach and methodology in relation to data collection. *This should include the following information as a minimum:* ● *Data collection procedures - how data was requested and gathered, who supplied each data point, the format data was received in, and the date data points were received* ● *How data quality was assessed and how the data hierarchy was followed in terms of using measured, calculated and estimated data. Evidence and justification should be provided in any cases where measured data was not used* ● *Details of data validation processes followed, including treatment of missing data* *Evidence of all raw data that informed the assessment (including data that informed any assumptions) must be appended to the PDD or linked within the GHG Statement.*
No changes have been made since the last submission period

GHG Statement Methodology - Calculations
Provide information on the GHG Statement approach and methodology in relation to calculations. *This should include the following information as a minimum:* ● *General description of the methodology, criteria and procedures used as a basis for the assessment, including reference to any documentation (including Isometric protocols and modules), guidance, industry standards and best practice that were followed* ● *Information on calculation procedures followed* ● *Information on any tools used as part of the assessment* ● *Procedure for selecting emission factors including how age (age of data, and the period over which they have been collected), geography (the region or country from where the data have originated), technology (whether the data are specific to a particular technology or mix of many), methodology (the approach applied to gather or calculate the data) and competency (proficiency of entity that developed the data) were considered.* ● *Assumptions and limitations - provide full transparency in terms of value-choices, rationales and expert judgements* ● *Details of a sensitivity analysis, how parameters were assessed and evidence behind choices* ● *Details of uncertainty analysis*

- *Details of any uncertainty adjustments (e.g. %) applied in instances of high uncertainty*

Baseline Calculations
The baseline calculations have been updated using injection volume data through December 2025. The new baseline volume will now be 933.79 US tons/week. Because the previous audit period had a falsely low cushion, an additional 15 US tons/week will be added for the number of weeks equivalent to the length of the previous audit period.

The first verification contained seven weeks, so the initial seven weeks of the 2nd (current) verification will have a baseline of 948.79 US tons/week. The remaining weeks of the verification period will be 933.79 US tons/week.

GHG Statement Results

The following information should be provided in this section:
- *Baseline results reported in t CO_2e for the Reporting Period*
- *Net CO_2e removals results reported in t CO_2e for the Reporting Period. These must be aggregated and also broken down into GHG SSRs*
- *If it has not already been covered in the* 'Uncertainty assessment' section of the PDD, provide *outcomes of sensitivity and uncertainty analyses including a statement of how uncertainty affects the results and how it has been addressed to minimize misrepresentation*
- *A statement of how the assumptions and choices made in the assessment are conservative*

The GHG Statement calculations must be provided separately, including all raw data and evidence. The GHG Statement calculations must be clearly referenced with a transparent audit trail of evidence, decision making, assumptions, explanations.

Vaulted geologically sequestered **21927.76 US tons** of waste during this audit period. The baseline for this audit period is **18,780.8 US tons** of waste across 20 weeks, leading to creditable waste volumes sequestered to **8,933.361** US tons of waste, equivalent to **2477.89 metric tons** of gross CO_2. Associated with this activity, a number of emissions occurred, including:

- 79.85 tons of CO_2 emissions from energy consumption on site
- 0.956 tons of CO_2 emissions from receiving HPE
- 20.051 tons of CO_2 emissions from transportation to facility
- 1.581 tons of CO_2 emissions from foreign material transportation
- 1.053 tons of CO_2 emissions from propane consumption on site
- 0 tons of CO_2 emissions from embedded carbon
- 0.05195 tons of CO_2 emissions from lab sampling
- 2.333 tons of CO_2 emissions from Pump Maintenance
- 24.679 tons of CO_2 emissions from Counterfactual (2.92%)

Together, a total of **130.56 tons** of CO2e were emitted due to the carbon removal activities.

This resulted in a total of **2,347.33 net tons** of CO2e removed from the atmosphere.

Please refer to the TIRE PDD for a detailed explanation of assumptions and choices made.
